Introduction
The positive characteristic case
Algebraic Stacks
On stacks and topological spaces

Let k be an algebraically closed uncountable field and let S be a smooth projective connected surface over k. Assume that the irregularity $q(S) = 0$. We study smooth projective curves on a surface of general type with geometric genus $p_g(S) = 0$ (and hence $q(S) = 0$) or a $K3$-surface.

The Gysin homomorphism
Intermezzo on Cycles and Chow groups
The Gysin kernel

Let S be a smooth projective connected surface over an algebraically closed field k and Σ the linear system of a very ample divisor D on S. Let $d := \dim(\Sigma)$ be the dimension of Σ and

$$\varphi_\Sigma : S \hookrightarrow \mathbb{P}^d$$

the closed embedding of S into $\mathbb{P}^d$, induced by Σ.

For any closed point $t \in \Sigma \cong \mathbb{P}^{d^*}$, let C_t be the corresponding hyperplane section on S, and let

$$r_t : C_t \hookrightarrow S$$

be the closed embedding of the curve C_t into S.

Introduction
The positive characteristic case

On stacks and topological spaces

The Gysin homomorphism
Intermezzo on Cycles and Chow groups
The Gysin kernel

Let Δ be the discriminant locus of Σ, that is,

$$\Delta := \{t \in \Sigma : C_t \text{ is singular}\}.$$

Then

$$U := \Sigma \smallsetminus \Delta = \{t \in \Sigma : C_t \text{ is smooth}\}.$$

Let

$$r_t^* : H^1(C_t, \mathbb{Z}) \to H^3(S, \mathbb{Z})$$

be the Gysin homomorphism on cohomology groups induced by r_t, whose kernel $H^1(C_t, \mathbb{Z})_{\text{van}}$ is called the *vanishing cohomology* of C_t (see [VoiI], 3.2.3).

Introduction
The positive characteristic case
Algebraic Stacks
On stacks and topological spaces

The Gysin homomorphism
Intermezzo on Cycles and Chow groups
The Gysin kernel

Let $J_t = J(C_t)$ be the Jacobian of the curve C_t and let B_t be the abelian subvariety of the abelian variety J_t corresponding to the Hodge substructure $H^1(C_t, \mathbb{Z})_{\text{van}}$ of $H^1(C_t, \mathbb{Z})$.

Let $\text{CH}_0(S)_{\text{deg}=0}$ be the Chow group of 0-cycles of degree zero on S, and for any closed point $t \in \Sigma$, let $\text{CH}_0(C_t)_{\text{deg}=0}$ be the Chow group of 0-cycles of degree zero on C_t.

For any closed point $t \in \Sigma$, let

$$r_t^* : \text{CH}_0(C_t)_{\text{deg}=0} \to \text{CH}_0(S)_{\text{deg}=0}$$

be the Gysin pushforward homomorphism on the Chow groups of degree zero 0-cycles of C_t and S, respectively, induced by r_t, whose kernel

$$G_t = \ker(r_t^*)$$

is called the *Gysin kernel* associated with the hyperplane section C_t.

The Gysin homomorphism
Intermezzo on Cycles and Chow groups
The Gysin kernel

Intermezzo on Cycles and Chow groups

Let X denote a smooth projective variety over an algebraically closed field k.

Definition

● An algebraic cycle of dimension r or simply an r-cycle is a finite formal linear combination

$$Z = \sum n_i Z_i,$$

where $n_i \in \mathbb{Z}$ and Z_i is a subvariety of X of dimension r.

● The group of r-cycles is denoted by $Z_r(X)$.

● Thinking in terms of codimension and if X is of dimension n we write

$$Z_r(X) = Z^{n-r}(X).$$

$Z^{n-r}(X)$ is the group of cycles of codimension $(n-r)$ on X.

Introduction
The positive characteristic case
Algebraic Stacks
On stacks and topological spaces

The Gysin homomorphism
Intermezzo on Cycles and Chow groups
The Gysin kernel

Examples

Let X be a smooth projective variety of dimension n.

1. The 0-cycles on X are finite formal linear combinations

$$Z = \sum n_i P_i,$$

where $n_i \in \mathbb{Z}$ and P_i is a point on X. The group of 0-cycles is denoted by $Z_0(X)$.

2. The cycles of codimension 1 on X are finite formal linear combinations

$$Z = \sum n_i Z_i,$$

where $n_i \in Z$ and Z_i is a subvariety of codimension 1 of X. The cycles of codimension 1 are also called divisors. The group of cycles of codimension 1 is denoted by $Z^1(X)$ or by $\mathrm{Div}(X)$.

# Rational and algebraic equivalence

Definition

● Two r-cycles Z_1 and Z_2 on X are rationally equivalent if there exists a family of r-cycles parametrized by $\mathbb{P}^1$ interpolating between them, i.e. if there is $W \in Z_{r+1}(\mathbb{P}^1 \times X)$ not contained in any fiber $\{t\} \times X = \mathrm{pr}_1^{-1}(t), t \in \mathbb{P}^1$, such that defining by

$$W(t) := [W \cap (\{t\} \times X)]$$

the r-cycle obtained by intersecting W with the fiber $\{t\} \times X$ over t, we have

$$Z_1 = W(t_1) \text{ and } Z_2 = W(t_2) \text{ for some } t_1, t_2 \in \mathbb{P}^1.$$

● If in the above definition we replace $\mathbb{P}^1$ by any smooth curve then we say that Z_1 and Z_2 are algebraically equivalent.

The Gysin kernel

Properties

● The r-cycles rationally equivalent to 0 on X, denoted by

$$Z_r(X)_{\mathrm{rat}} = \{Z \in Z_r(X) : Z \sim_{\mathrm{rat}} 0\}$$

form a subgroup of $Z_r(X)$.

● The r-cycles algebraically equivalent to 0 on X, denoted by

$$Z_r(X)_{\mathrm{alg}} = \{Z \in Z_r(X) : Z \sim_{\mathrm{alg}} 0\}$$

form a subgroup of $Z_r(X)$.

Intermezzo on Cycles and Chow groups
The Gysin kernel

Results on codimension 1-cycles or divisors

In this case one has good results.

● We have

$$CH^1(X) = Z^1(X)/Z^1(X)_{rat} \cong Pic(X) \cong H^1_{Zar}(X, \mathcal{O}_X^*),$$

where $Pic(X)$ is the group of isomorphism classes of invertible sheaves on X called the Picard group, and $H^1_{Zar}(X, \mathcal{O}_X^*)$ is the group of isomorphism classes of line bundles on X. One can make this group into a scheme.

● We have

$$NS(X) := Z^1(X)/Z^1(X)_{alg},$$

it is a finitely generated abelian group, called the Neron-Severi group of X.

Introduction
The positive characteristic case
Algebraic Stacks
On stacks and topological spaces

The Gysin homomorphism
Intermezzo on Cycles and Chow groups
The Gysin kernel

The quotient group

$$A^1(X) := Z^1(X)_{\text{alg}} / Z^1(X)_{\text{rat}}$$

is the connected component of unity of the scheme $\text{Pic}(X)$ denoted by $\text{Pic}^0(X)$. In $\text{char}(k) = 0$ it has the structure of an Abelian variety called the Picard variety. $A^1(X)$ is representable and we can think of it as a torus.

Introduction
The positive characteristic case
Algebraic Stacks
On stacks and topological spaces

The Gysin homomorphism
Intermezzo on Cycles and Chow groups
The Gysin kernel

In contrast to the case of cycles of codimension 1 very little is known about the above groups of cycles classes. For example, if $r > 1$

- We do not know if

$$Z^r(Z)/Z^r(Z)_{\text{alg}}$$

  is a finitely generated abelian group.

- In general

$$A^r(X) = Z^r(X)_{\text{alg}}/Z^r(X)_{\text{rat}}$$

  is not representable. That is:

  In studying algebraic cycles we encounter objects which are geometric in content and simultaneously not representable!

Introduction
The positive characteristic case
Algebraic Stacks
On stacks and topological spaces

The Gysin homomorphism
Intermezzo on Cycles and Chow groups
The Gysin kernel

Let $k \cong \mathbb{C}$ and $U = \Sigma \smallsetminus \Delta$.

Theorem (Paucar - S., 2022/2024)

(a) *For each $t \in U$ there is an abelian variety $A_t \subset B_t$ such that*

$$G_t = \ker(r_{t*}) = \bigcup_{countable} \text{ translates of } A_t$$

(b) *For a very general $t \in U$ (i.e. for every t in a c-open subset U_0 of U) either*

   1. $A_t = B_t$, and then $G_t = \bigcup_{countable}$ translates of B_t, or
   2. $A_t = 0$, and then G_t is countable.

(c) *If $alb_S : CH_0(S)_{hom} \to Alb(S)$ is not an isomorphism, for a very general t in U, then G_t is countable.*

Introduction
The positive characteristic case
Algebraic Stacks
On stacks and topological spaces

The Gysin homomorphism
Intermezzo on Cycles and Chow groups
The Gysin kernel

- The subset U_0 is countable open $\rightsquigarrow$ allows to apply for all t in U_0 in a uniform way the irreducibility of the monodromy representation on the vanishing cohomology of a smooth section (see [DK73], [D74] for the étale cohomology, [La81] for the singular cohomology and [VoiII] in a Hodge theoretical context for complex algebraic varieties).

- this is done by viewing $U = \Sigma \smallsetminus \Delta$ as an integral algebraic scheme over k and by passing to the general fiber, i.e. for each closed point t in U_0 there exists a scheme-theoretic isomorphism to the geometric generic point $\overline{\xi}$ over k', where k' is the minimal field of definition of S [Wei62]. This induces a scheme-theoretic isomorphism κ_t between the corresponding varieties C_t and $C_{\overline{\xi}}$ over k'.

Introduction
The positive characteristic case
Algebraic Stacks
On stacks and topological spaces

The Gysin homomorphism
Intermezzo on Cycles and Chow groups
The Gysin kernel

The groups $CH_0(C_t)$ and $CH_0(C_{\overline{\xi}})$ are presented by abelian varieties A_t and $A_{\overline{\xi}}$, respectively, for t in U_0, as C_t is a smooth curve.

This induces an isomorphism κ'_t between A_t and $A_{\overline{\xi}}$ compatible with the isomorphism on Chow groups induced by the isomorphism κ_t.

Then by [BG20] $\kappa'_t(A_t) = A_{\overline{\xi}}$ and $\kappa'_t(B_t) = B_{\overline{\xi}}$ for every k-point in U_0.

Introduction
The positive characteristic case
Algebraic Stacks
On stacks and topological spaces

The Gysin homomorphism
Intermezzo on Cycles and Chow groups
The Gysin kernel

- Goal: extend the argument to an algebraically closed field k

  Describe the Gysin kernel G_t for the points t in $U \smallsetminus U_0$ by the local and global monodromy representations, i.e. the action of the fundamental groups $\pi_1(V, t)$, where $V = (\Sigma \smallsetminus \Delta) \cap D$ with D a line containing t in the dual space $\mathbb{P}^{d^*}$ such that f_D is a Lefschetz pencil for S, and $\pi_1(U, t)$ on the vanishing cohomology $H^1(C_t, k')_{\text{van}}$.

- Approach: for k uncountable and of positive characteristic: give similar arguments as in the zero characteristic case where possible, use two Comparison Theorems and the existence of a lift from positive to zero characteristic given by the ring of Witt vectors and its residue field (Werner - S., 2024).

Introduction
The positive characteristic case
Algebraic Stacks
On stacks and topological spaces

The Gysin homomorphism
Intermezzo on Cycles and Chow groups
The Gysin kernel

- Consider algebraic stacks as a generalisation of complex algebraic varieties

  Construct a stratification $\{\mathcal{U}_i \subseteq U\}_{i \in I}$ of U by countable open substacks for each of which the monodromy argument applies for all $t \in \mathcal{U}_i$ in a uniform way (i.e. for a partially ordered, at most countable set I we have $\mathcal{U}_i \subseteq \mathcal{U}_j$ if $i \le j$ and two additional conditions on I for finiteness from below and for every map $\alpha : \operatorname{Spec}(k) \to U$ the set $\{i \in I : \alpha \text{ factors through } \mathcal{U}_i\}$ has a smallest element (cf. [GL19], Def. 5.2.1.1).

  We then apply a convergence argument for the stratification $\{\mathcal{U}_i\}_{i \in I}$ (cf. [GL19], Def. 5.2.2.1) such that the monodromy argument applies in a uniform way for all $t \in U$, seen as the set-theoretic directed union $U = \underset{\underset{i}{\to}}{\cup}\, \mathcal{U}_i$.

Introduction
The positive characteristic case
Algebraic Stacks
On stacks and topological spaces

Witt vectors
Comparison theorems

Think of k as the field $\overline{\mathbb{F}_p((x))}$, the algebraic closure of the formal Laurent series over $\mathbb{F}_p$, since there is a unique (up to non-canonical isomorphism) algebraically closed field of characteristic p of cardinality $\mathcal{K}$.

Every algebraically closed field is perfect thus we have an unramified complete discrete valuation ring $W(k)$ such that $\mathrm{char}(W(k)) = 0$ with k as its residue field. Let $K = \mathrm{Frac}(W(k))$ be the fraction field of $W(k)$ and $\overline{K}$ its algebraic closure.

$W(k)$ is called the ring of Witt vectors.

Introduction
The positive characteristic case
Algebraic Stacks
On stacks and topological spaces

Witt vectors
Comparison theorems

We have the *Lefschetz's principle* "there is but one algebraic geometry of characteristic p for each value of p"

and the stronger statement "algebraic geometry over an arbitrary algebraically closed field of characteristic 0 is 'the same' as algebraic geometry over $\mathbb{C}$".

J. Barwise and P. Eklo proved it meta-mathematically [BaEk69].

Thus, doing algebraic geometry over $\overline{K}$ is 'the same' as doing algebraic geometry over $\mathbb{C}$.

Introduction
The positive characteristic case
Algebraic Stacks
On stacks and topological spaces

Witt vectors
Comparison theorems

With the two comparison theorems we switch from working with singular cohomology to étale cohomology and then working with the étale cohomology over the special fiber:

Theorem (Milne 2013, 21.1)

Let X be a nonsingular variety over $\mathbb{C}$. For any finite abelian group Λ and $r \geq 0$, $H_{et}^r(X, \Lambda) \cong H^r(X, \Lambda)$, where $H^r(X, \Lambda)$ is the classic singular cohomology.

Theorem (Milne 2013, 20.5)

Suppose that a variety X_0 over an algebraically closed field k of characteristic $p \neq 0$ can be lifted to a variety X_1 over a fixed field K of characteristic zero. For any abelian group Λ,

$$H^r(X_0, \Lambda) \cong H^r(X_{1,\overline{K}}, \Lambda),$$

where $X_{1,\overline{K}}$ is the variety over the algebraic closure of K.

Introduction
The positive characteristic case
Algebraic Stacks
On stacks and topological spaces

Witt vectors
Comparison theorems

In the art of proving part (a) of the theorem on the Gysin kernel we show that all pre-lemmas and propositions about the countability of varieties, regularity and representability of the Chow group $CH_0(X)_{\deg=0}$ of 0-cycles of degree zero still hold true in the general setting.

Then we use cohomological arguments, the lift and comparison theorems on the previous results showed initially over $\mathbb{C}$.

Introduction
The positive characteristic case
Algebraic Stacks
On stacks and topological spaces

Witt vectors
Comparison theorems

For part (b), we are highly inspired and follow closely [BG20, 6] to show that the (étale) fundamental group $\pi_1(U_0, \overline{\eta})$ based on the geometric generic point acts continuously on the cohomology groups we work with. In particular, we can always work with a Lefschetz pencil and analyze the vanishing cycles which are irreducible.

Introduction
The positive characteristic case
Algebraic Stacks
On stacks and topological spaces

Affine schemes, schemes and algebraic stacks
Stratifications of Algebraic Stacks
Construction of the stratification

Affine schemes, schemes and algebraic stacks

Definition (Ringed space)

A ringed space $(X, \mathcal{O}_X)$ is a topological space X together with a sheaf of rings $\mathcal{O}_X$ on X. The sheaf $\mathcal{O}_X$ is called the structure sheaf of X.

Definition (Locally ringed space)

A locally ringed space is a ringed space $(X, \mathcal{O}_X)$ such that all stalks of $\mathcal{O}_X$ are local rings (i.e. they have unique maximal ideals).

Notice: It is <u>not</u> required that $\mathcal{O}_X(U)$ be a local ring for every open set U; in fact, this is almost never the case.

Introduction
The positive characteristic case
Algebraic Stacks
On stacks and topological spaces

Affine schemes, schemes and algebraic stacks
Stratifications of Algebraic Stacks
Construction of the stratification

Definition (Affine scheme)

Let R be a commutative ring. An affine scheme is a locally ringed space S such that $S \cong \mathrm{Spec}(R)$.

Definition (Scheme)

A scheme is a locally ringed space S admitting a covering by open sets U_i, s.t. each U_i (as a locally ringed space) is an affine scheme. In particular: S comes with a sheaf $\mathcal{O}_S : U \mapsto \mathcal{O}_S(U)$ for every open subset U, the ring of regular functions on U.

$\rightarrow$ think of a scheme S as being covered by "coordinate charts" which are affine schemes

$\rightarrow$ obtain a scheme S by glueing together affine schemes using the Zariski topology

Introduction
The positive characteristic case
Algebraic Stacks
On stacks and topological spaces

Affine schemes, schemes and algebraic stacks
Stratifications of Algebraic Stacks
Construction of the stratification

Example: (Affine scheme)

$\mathbb{A}_k^n$ = affine n-space over a field k, for $n \in \mathbb{N}$

by definition we have $\mathbb{A}_k^n := \mathrm{Spec}(k[x_1, \ldots, x_n])$

it can be defined over any commutative ring R:

$\mathbb{A}_k^n := \mathrm{Spec}(R[x_1, \ldots, x_n])$

Introduction
The positive characteristic case
Algebraic Stacks
On stacks and topological spaces

Affine schemes, schemes and algebraic stacks
Stratifications of Algebraic Stacks
Construction of the stratification

Example: (Scheme)

- Every affine scheme $S := \mathrm{Spec}(R)$ is a scheme

- A polynomial $f \in k[x_1, \ldots, x_n]$ determines a closed subscheme $f \equiv 0$ in affine space $\mathbb{A}_k^n$, called an affine hypersurface. Formally this is

  $$\mathrm{Spec}(k[x_1, \ldots, x_n])/(f)$$

  for example: let $k \cong \mathbb{C}$, then $x^2 = y^2(y+1)$ defines a singular curve in $\mathbb{A}_{\mathbb{C}}^2$, a nodal cubic curve.

- $\mathbb{P}_R^n$ can be constructed as a scheme: glueing $(n+1)$ copies of affine n-space over R along open subsets

  $$\mathbb{A}_R^n \otimes_n \mathbb{A}_R^n \otimes_n \ldots \otimes_n \mathbb{A}_R^n \quad (n+1) \text{ copies}$$

Introduction
The positive characteristic case
Algebraic Stacks
On stacks and topological spaces

Affine schemes, schemes and algebraic stacks
Stratifications of Algebraic Stacks
Construction of the stratification

Remark: An algebraic variety X over a field k can be defined as a scheme with certain properties. There are different conventions which schemes should be called varieties. One standard choice: a variety X/k is an integral algebraic scheme of finite type over k.

Remark: A smooth scheme is a generalisation of the concept of a non-singular algebraic variety.

In particular: a smooth scheme of finite type over $\overline{k}$ is a non-singular algebraic variety.

Let $k \cong \mathbb{C}$. A non-singular algebraic variety X/k has the structure of a complex analytic manifold.

Introduction
The positive characteristic case
Algebraic Stacks
On stacks and topological spaces

Affine schemes, schemes and algebraic stacks
Stratifications of Algebraic Stacks
Construction of the stratification

Let S be a k-scheme.

Definition (Algebraic stack)

$\mathcal{X}$ is an algebraic stack if there exists a scheme U and a map $U \to \mathcal{X}$ which is representable by smooth surjections.

In other words: for every S-valued point of $\mathcal{X}$, the fiber product $U \times_{\mathcal{X}} S$ is representable by a smooth S-scheme U_S with non-empty fibers.

Introduction
The positive characteristic case
Algebraic Stacks
On stacks and topological spaces

Affine schemes, schemes and algebraic stacks
Stratifications of Algebraic Stacks
Construction of the stratification

Definition (Gaitsgory - Lurie, 2019)

Let $\mathcal{X}$ be an algebraic stack. A **stratification** of $\mathcal{X}$ consists of the following data:

(a) A partially ordered set A.

(b) A collection of open substacks $\{\mathcal{U}_\alpha \subseteq \mathcal{X}\}_{\alpha \in A}$ satisfying $\mathcal{U}_\alpha \subseteq \mathcal{U}_\beta$ when $\alpha \leq \beta$.

This data is required to satisfy the following conditions:

- For each index $\alpha \in A$, the set $\{\beta \in A : \beta \leq \alpha\}$ is finite.

- For every field m and every map $\eta : \mathrm{Spec}(m) \to \mathcal{X}$, the set

  $$\{\alpha \in A : \eta \text{ factors through } \mathcal{U}_\alpha\}$$

  has a least element.

Introduction
The positive characteristic case
Algebraic Stacks
On stacks and topological spaces

Affine schemes, schemes and algebraic stacks
Stratifications of Algebraic Stacks
Construction of the stratification

Let $\mathcal{X}$ be an algebraic stack equipped with a stratification $\{\mathcal{U}_\alpha\}_{\alpha \in A}$. Notation: For each $\alpha \in A$, we let $\mathcal{X}_\alpha$ denote the reduced closed substack of $\mathcal{X}$ given by the complement of $\cup_{\beta < \alpha} \mathcal{U}_\beta$. Each $\mathcal{X}_\alpha$ is a locally closed substack of $\mathcal{X}$, called the **strata** of $\mathcal{X}$.

Remark

A stratification $\{\mathcal{U}_\alpha\}_{\alpha \in A}$ is determined by the partially ordered set A together with a collection of locally closed substacks $\{\mathcal{X}_\alpha\}_{\alpha \in A}$: each $\mathcal{U}_\alpha$ is an open substack of $\mathcal{X}$ and if m is a field, then a map $\eta : \mathrm{Spec}(m) \to \mathcal{X}$ factors through $\mathcal{U}_\alpha$ iff it factors through $\mathcal{X}_\beta$ for some $\beta \le \alpha$. So one identifies the stratification of $\mathcal{X}$ with the locally closed substacks $\{\mathcal{X}_\alpha \subseteq \mathcal{X}\}_{\alpha \in A}$ (where the partial ordering of A is understood to be implicitly specified).

Remark

*If m is a field, then for any map $\eta : \mathrm{Spec}(m) \to \mathcal{X}$ there is a **unique** index $\alpha \in A$ such that η factors through $\mathcal{X}_\alpha$. In other words, $\mathcal{X}$ is the **set-theoretic** union of the locally closed substacks $\mathcal{X}_\alpha$.*

Introduction
The positive characteristic case
Algebraic Stacks
On stacks and topological spaces

Affine schemes, schemes and algebraic stacks
Stratifications of Algebraic Stacks
Construction of the stratification

Definition

Let $m = \mathbb{C}$ or $m = \mathbb{F}_q$ and let $\mathcal{X}$ be an algebraic stack of finite type over $\mathrm{Spec}\,(m)$. A stratification $\{\mathcal{X}_\alpha\}_{\alpha \in A}$ of $\mathcal{X}$ is **convergent** if there exists a finite collection of algebraic stacks $\mathcal{T}_1, \ldots, \mathcal{T}_n$ over $\mathrm{Spec}\,(m)$ with the following properties:

(1) For each $\alpha \in A$ there exists an integer $i \in \{1, 2, \ldots, n\}$ and a diagram of algebraic stacks $\mathcal{T}_i \xrightarrow{f} \tilde{\mathcal{X}}_\alpha \xrightarrow{g} \mathcal{X}_\alpha$ where the map f is a fiber bundle (locally trivial with respect to the étale topology) whose fibers are affine spaces of some fixed dimension d_α and the map g is surjective, finite and radicial.

(2) The nonnegative integers d_α in (1) satisfy $\sum_{\alpha \in A} q^{-d_\alpha} < \infty$.

(3) For $1 \le i \le n$, the algebraic stack $\mathcal{T}_i$ can be written as a stack-theoretic quotient Y/G, where Y is an algebraic space of finite type over m and G is a linear algebraic group over m acting on Y.

Introduction
The positive characteristic case
Algebraic Stacks
On stacks and topological spaces

Affine schemes, schemes and algebraic stacks
Stratifications of Algebraic Stacks
Construction of the stratification

Remark

In the definition, for $\text{char}(m) > 0$ the hypothesis (2) guarantees that the set A is at most countable. For $\text{char}(m) = 0$ we will assume A to be at most countable.

We have the following

Lemma (Gysin sequence)

Let X and Y be smooth quasi-projective varieties over an algebraically closed field k, let $g : Y \to X$ be a finite radicial morphism, and let $U \subseteq X$ be the complement of the image of g. Then there is a canonical fiber sequence

$$C^{*-2d}(Y; \mathbb{Z}_l(-d)) \to C^*(X, \mathbb{Z}_l) \to C^*(U; \mathbb{Z}_l),$$

where d denotes the relative dimension $\dim(X) - \dim(Y)$.

Introduction
The positive characteristic case
Algebraic Stacks
On stacks and topological spaces

Affine schemes, schemes and algebraic stacks
Stratifications of Algebraic Stacks
Construction of the stratification

This implies a corresponding result for algebraic stacks:

Lemma

Let $\mathcal{X}$ and $\mathcal{Y}$ be smooth algebraic stacks of constant dimension over an algebraically closed field k, let $g : \mathcal{Y} \to \mathcal{X}$ be a finite radicial morphism, and let $\mathcal{U} \subseteq \mathcal{X}$ be the open substack of $\mathcal{X}$ complementary to the image of g. Then there is a canonical fiber sequence

$$C^{*-2d}(\mathcal{Y}; \mathbb{Z}_l(-d)) \to C^*(\mathcal{X}, \mathbb{Z}_l) \to C^*(\mathcal{U}; \mathbb{Z}_l),$$

where d denotes the relative dimension $\dim(\mathcal{X}) - \dim(\mathcal{Y})$.

Introduction
The positive characteristic case
Algebraic Stacks
On stacks and topological spaces

Affine schemes, schemes and algebraic stacks
Stratifications of Algebraic Stacks
Construction of the stratification

We have the following

Theorem (S., 2025)

Let $U := \Sigma \setminus \Delta$. There exists a convergent stratification $\{\mathcal{U}_\alpha\}_{\alpha \in A}$ of U by countable open substacks for each of which the irreducibility of the monodromy representation applies for all $t \in \mathcal{U}_\alpha$ in a uniform way such that the monodromy argument applies for all $t \in U$ in a uniform way, seen as the set-theoretic directed union $U = \underset{\overrightarrow{i}}{\cup} \mathcal{U}_i$.

Proof.

Let $d = \dim(U)$ and let $\{\mathcal{X}_\alpha\}_{\alpha \in A}$ be the given stratification of U. The set A is at most countable (see Remark). By adding additional elements to A and assigning to each of those additional elements the empty substack of U, we may assume that A is infinite.

Introduction
The positive characteristic case
Algebraic Stacks
On stacks and topological spaces

Affine schemes, schemes and algebraic stacks
Stratifications of Algebraic Stacks
Construction of the stratification

By assumption the set $\{\beta \in A : \beta \leq \alpha\}$ is finite for each $\alpha \in A$, hence we can chose an enumeration

$$A = \{\alpha_0, \alpha_1, \alpha_2, \ldots\}$$

where each initial segment is a downward-closed subset of A. We can then write U as the union of an increasing sequence of open substacks

$$\mathcal{U}_0 \hookrightarrow \mathcal{U}_1 \hookrightarrow \mathcal{U}_2 \hookrightarrow \ldots$$

where $\mathcal{U}_n$ is characterized by the requirement that if m is a field, then a map $\eta : \mathrm{Spec}(m) \to \mathcal{X}$ factors through $\mathcal{U}_n$ iff it factors through one of the substacks $\mathcal{X}_{\alpha_0}, \mathcal{X}_{\alpha_1}, \ldots, \mathcal{X}_{\alpha_n}$.

Stratifications of Algebraic Stacks
Construction of the stratification

By hypothesis, there exists a finite collection $\{\mathcal{T}_i\}_{1 \le i \le s}$ of smooth algebraic stacks over $\mathrm{Spec}(m)$, where each $\mathcal{T}_i$ has some fixed dimension d_i and for each $n \ge 0$ there exists an index $i(n) \in \{1, \ldots, s\}$ and a diagram

$$\mathcal{T}_{i(n)} \stackrel{f_n}{\to} \tilde{\mathcal{X}}_{\alpha_n} \stackrel{g_n}{\to} \mathcal{X}_{\alpha_n},$$

where g_n is a finite radicial surjection and f_n is an étale fiber bundle whose fibers are affine spaces of some fixed dimension $e(n)$. Set

$$\overline{U} = U \times_{\mathrm{Spec}(m)} \mathrm{Spec}(\overline{m})$$

$$\overline{\mathcal{U}}_n = \mathcal{U}_n \times_{\mathrm{Spec}(m)} \mathrm{Spec}(\overline{m})$$

$$\overline{\mathcal{T}}_i = \mathcal{T}_i \times_{\mathrm{Spec}(m)} \mathrm{Spec}(\overline{m})$$

Stratifications of Algebraic Stacks
Construction of the stratification

The map f_n induces an isomorphism in l-adic cohomology. Applying the above Lemma to the finite radicial map

$$g_n : \overline{\mathcal{X}}_{\alpha_n} \times_{\mathrm{Spec}(m)} \mathrm{Spec}(\overline{m}) \to \overline{\mathcal{U}}_n$$

we obtain fiber sequences

$$C^{*-2e'_n}(\overline{\mathcal{T}}_{i(n)}; \mathbb{Z}_l(-e'_n)) \to C^*(\overline{\mathcal{U}}_n, \mathbb{Z}_l) \to C^*(\overline{\mathcal{U}}_{n-1}; \mathbb{Z}_l),$$

where $e'_n = e_n + d - d_{i(n)}$ denotes the relative dimension of the map $\tilde{\mathcal{X}}_{\alpha_n} \to U$. We have a canonical equivalence

$$\Theta : C^*(\overline{U}; \mathbb{Z}_l) \simeq \varprojlim_n C^*(\overline{\mathcal{U}}_n, \mathbb{Z}_l).$$

Construction of the stratification

Passing by the fiber complexes (Gysin sequence, Lemmas above) to the level of stacks, by the increasing sequence of c-open substacks

$$\mathcal{U}_0 \hookrightarrow \mathcal{U}_1 \hookrightarrow \mathcal{U}_2 \hookrightarrow \ldots$$

we obtain $U = \underset{\overrightarrow{n}}{\cup} \mathcal{U}_n$.

On stacks and topological spaces

On stacks and topological spaces

Let k be an algebraically closed field, let X be an algebraic curve over k, and let G be a smooth affine group scheme over X.

Goal: understand the cohomology of the moduli stack $\mathrm{Bun}_G(X)$ of principle G-bundles on X.

Here: Let $k = \mathbb{C}$ and let G be semisimple simply connected.

Calculating the cohomology of $\mathrm{Bun}_G(X) \rightsquigarrow$ can be seen as a purely topological problem, using classical methods.

Assume additionally that the group scheme G is constant (i.e. it arises from a linear algebraic group over $\mathbb{C}$)$\rightsquigarrow$ there is a simple explicit description of the rational cohomology ring $H^*(\mathrm{Bun}_G(X); \mathbb{Q})$, due originally to Atiyah and Bott.

Introduction
The positive characteristic case
Algebraic Stacks
On stacks and topological spaces

Let BG denote a classifying space of G, in the sense of algebraic topology: that is a quotient EG$/G$, where EG is a contractible space equipped with a free action of G.

BG has the universal mapping property: for any reasonably well-behaved topological space Y (e.g. any paracompact manifold), the construction

$$(f : Y \rightarrow \text{BG}) \mapsto Y \times_{\text{BG}} \text{EG}$$

determines a bijection from the set $[Y, \text{BG}]$ of homotopy classes of continuous maps from Y into BG to the set of isomorphism classes of G-bundles on Y (in the category of topological spaces).

Introduction
The positive characteristic case
Algebraic Stacks
On stacks and topological spaces

Let M be a manifold and $\mathrm{Map}(M, \mathrm{BG}) := \{f : M \to \mathrm{BG} \,|\, f \text{ continuous}\}$. Regard $\mathrm{Map}(M, \mathrm{BG})$ as a topological space by equipping it with the compact open topology.

$\rightsquigarrow \mathrm{Map}(M, \mathrm{BG})$ classifies *G-bundles over M* in the category of topological spaces: for any sufficiently nice parameter space Y identify homotopy classes of maps from Y to $\mathrm{Map}(M, \mathrm{BG})$ with isomorphism classes of principal *G*-bundles on the product $M \times Y$ in the category of topological spaces.

Introduction
The positive characteristic case
Algebraic Stacks
On stacks and topological spaces

We have the following

Proposition (Gaitsgory-Lurie, 2019)

Let X be a smooth projective algebraic curve over $\mathbb{C}$ that we identify with the compact Riemann surface $X(\mathbb{C})$ of $\mathbb{C}$-valued points of X. Let $\mathrm{Bun}_G(X) = \mathrm{Bun}_{G \times_{\mathrm{Spec}(\mathbb{C})} X}(X)$ denote the moduli stack of G-bundles on X. There is a canonical homotopy equivalence

$$\mathrm{Bun}_G(X) \simeq \mathrm{Map}(X, \mathrm{B}G).$$

Remark

The moduli stack $\mathrm{Bun}_G(X)$ and the mapping space $\mathrm{Map}(X, \mathrm{B}G)$ both have universal properties:
the former classifies G-bundles in the setting of algebraic geometry, and the latter classifies G-bundles in the setting of topological spaces.

The Atiyah-Bott Formula

⤳ may identify the cohomology of the moduli stack $\text{Bun}_G(X)$ with the cohomology of the mapping space $\text{Map}(X, BG)$.

⤳ give an explicit description of the rational cohomology of $\text{Map}(X, BG)$.

Starting point: the description of the rational cohomology of BG itself:

Proposition

Let G be a simply-connected linear algebraic group over $\mathbb{C}$ and let BG *denote the classifying space of G. Then the cohomology ring $H^*(BG; \mathbb{Q})$ is isomorphic to a polynomial algebra on finitely many homogeneous generators $x_1, x_2, \ldots, x_r$ with even degrees $e_1, \ldots, e_r \geq 4$.*

Introduction
The positive characteristic case
Algebraic Stacks
On stacks and topological spaces

Let $V = V^*$ be a graded vector space over $\mathbb{Q}$ and let $\mathrm{Sym}^*(V)$ denote the free graded-commutative algebra generated by V.

Theorem (Atiyah-Bott)

There is an isomorphism of graded algebras

$$\mathrm{Sym}^*(H_*(X;\mathbb{Q}) \times_{\mathbb{Q}} V) \to H^*(\mathrm{Map}(X,\mathrm{BG});\mathbb{Q}).$$

More explicitly: let g be the genus of the curve X and let $e_1, e_2, \ldots, e_r$ denote the degrees of the polynomial generators of the cohomology ring $H^*(\mathrm{BG};\mathbb{Q})$. The cohomology ring $H^*(\mathrm{Map}(X;\mathrm{BG});\mathbb{Q})$ is isomorphic to a tensor product of a polynomial ring on $2r$ generators (of degrees e_i and $e_i - 2$ for $1 \leq i \leq r$) with an exterior algebra on $2gr$ generators (with $2g$ generators of each degree $e_i - 1$).
